Summary

Software engineer with 4+ years shipping production systems end to end. First engineer at Mando, an AI platform for Workday customers: five product surfaces from first commit to the company's first paid tier in under two years. Previously two years on real-time trading systems at Quantitative Brokers, working to hard latency budgets.

Work Experience

Founding Software Engineer

Sep 2024 – Present

Mando

Remote

- Designed the conversational search layer for Workday customers, owning retrieval, ranking and cited answer generation, so enterprise users get an answer instead of a list of documents.
- Shipped the expert consultation product alone, from time-zone-aware booking to live video on Azure Communication Services, in-call controls, recording and a browser-based editor for trimming and annotating footage.
- Built the service-management platform underneath it (ticket intake, routing, expert assignment, resolution) and a Chrome extension that records a workflow once and generates step-by-step documentation from it.
- Turned a demo into Mando's first paid tier by integrating Stripe subscriptions, checkout, invoicing and webhook-driven entitlement.
- Own the full stack as sole engineer: Next.js and FastAPI on PostgreSQL, with development, staging and production environments provisioned and maintained through Terraform.

Software Engineer

Jul 2022 – Sep 2024

Quantitative Brokers

Chennai, India

- Delivered real-time order monitoring that merges order flow from multiple sources into live aggregates and dynamic market data ladders for trading analysts.
- Cut risk control load time by over 97%, from roughly 40 seconds to under 1 second, by moving data loading server-side and adding incremental pagination.
- Reduced critical-path latency by 20% and CPU usage by 50% in a C# WPF order entry application consuming Bloomberg market data.
- Implemented DV01 (dollar value of a basis point) risk calculations for cash instruments, enabling the desk to expand its cash trading stream.

Earlier Experience: Software Development Intern, Quantitative Brokers (2021) — OpenFin desktop interop across four applications, Angular curve plotting over a live kdb+ database. Android Developer, Prescribe (2021) — Firebase-backed patient intake app. Software Development Intern, Workfence Technologies (2020) — geofencing attendance system, visualisation interface designed for 100,000 users.

Projects

leak — Terminal Subscription Manager

Go, Bubble Tea, SQLite, GitHub Actions

github.com/RishikeshSreekumar/leak

- Wrote a local-first terminal app that tracks and audits recurring subscriptions, shipped as one static Go binary with no server or telemetry.

deadfall — Dead Component Detector

TypeScript, Node.js, ts-morph, npm

npmjs.com/package/deadfall

- Published an npm CLI that parses a Next.js codebase into a component usage graph and identifies components unreachable from any rendered entry point.

Technical Skills

Languages: TypeScript, JavaScript, Python, Go, C#, Java, SQL

Frontend: React, Next.js, Angular, Astro, SvelteKit, Tailwind CSS, Three.js

Backend: FastAPI, SQLAlchemy, Node.js, NestJS, .NET (WPF), REST APIs, WebSockets, Stripe

Applied AI: LLM applications, retrieval-augmented generation (RAG), vector search, pgvector

Databases: PostgreSQL, Redis, SQLite, kdb+

Cloud & DevOps: Amazon Web Services (AWS), Microsoft Azure, Terraform, Docker, GitHub Actions, CI/CD, Vercel

Education

Indian Institute of Technology, Madras

2018 – 2022

B.Tech, Chemical Engineering — CGPA 8.58/10

Chennai, India
